

Getting etopsign to work in your existing systems is hassle-free and easy. All you have to do is choose docuprinter as the printer, and print from the core application.

Our special kiosk mode provides an easy way for the customer service representative to share a digital document with their customer. The second screen can have individual mouse control, so both screens can be used to work on two separate tasks simultaneously.

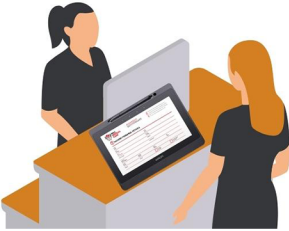

With etopsign, you can establish a set of rules for all your “document types.” Once defined, the software will recognize your document type and automatically insert a signature field. You’ll also be able to configure the document storage location, email dispatch, index criteria, and more within the software.

This way, your processes don’t only become easier to maintain – they also become automated.

Efficiency at your fingertips. Go digital with your signature.

Streamline and Simplify Your Processes

WinPC - Dual Screen Native Support

Enables the CSR and the customer to share the e-document and work separately without interfering.

Standalone Win Tablet Server Module

Manages communications between the core business systems and workstation tablets used by CSRs.

Thin Terminals Support with Digitizer

It is small in size, so you won't ever have to worry about it interrupting the performance of virtual application.
